Correct Claude Setup

Install 4 things before anything else. If any of them give you trouble, every short fixup video below is 2–3 minutes — you're not alone, this trips up most first-timers.

CLAUDE DESKTOP

GIT (WIN)

GIT (MAC)

NODE.JS

CLAUDE CHROME

❌ REMOTION FIX

❌ GIT FIX

❌ NODE.JS FIX

01 Install Claude's Desktop App

Your home base. Once open you can start chats and run Claude Code inside it.

02 Install Git Bash

Required for Claude Code on Windows (Git on Mac). If Claude later complains it can't find Git, reinstall and restart Claude.

03 Install Node.js

Powers the Remotion skill in Step 2. Pick the LTS version.

04 Install Claude's Chrome Extension

Lets Claude open Remotion (and any web tool) in your browser as part of the workflow.

❌ TIP — If something breaks after install, restart Claude Desktop. Most 'it doesn't work' moments are a stale process.

Install Remotion

Easiest part of the whole guide. Grab the Remotion skill command, paste it into Claude, and let it run.

[REMOTION HOME](#)[WATCH: QUICK INSTALL](#)

01 Open the Remotion site

Go to remotion.dev — the install snippet is on the home page. Click it a few times to copy.

02 Paste it into Claude

Open a Claude chat and paste the prompt below. Adding 'let me know when it is done' helps Claude give you a confirmation message.

03 Confirm install

Claude will either confirm success, ask you to pick a folder, or ask you to pick a template. Any of those = you're good.

❏ COPY THIS PROMPT

Next — install the Remotion skill.

```
npx create-video@latest
```

Let me know when you are done.

❏ TIP — Start a NEW chat for Part 3. Fresh context = better Enhance Claude results.

Enhance Claude

The pivot point. Two goals: (1) make Claude work BETTER — sticks to rules where it must, gets creative where it should; (2) make Claude work LONGER — spend tokens wisely so a single session carries the whole video (3–4× more output).

ANTIGRAVITY SKILL (GITHUB)

01 Create your project folder

Call it whatever you want — example: 'Learn VI'. This is the home base for one video project.

02 Inside it, create two subfolders

☒ Resources ☒ Skills

03 Drop these into Resources

Text Style · Scene Composition · Scene Revision & Versioning · Creative Unlock Rule · your 3 fonts · the Revision Prompts doc. All available in the Asset Pack.

04 Drop the Antigravity Skill into Skills

Built by KingStar Omega. It teaches Claude to be wiser with tokens — 3–4× more output per session.

☒ TIP — Why this matters: without Enhance Claude you get ~10 scenes before hitting a limit. With it, 30–40. Often: one session = one finished video.

Activate Claude Boosts

Now install Antigravity and load your Resources rules into Claude's memory.

01 Set your working folder

Tell Claude the path to your project folder so it can see Resources and Skills.

02 Install + activate Antigravity

Paste Prompt 1 below.

03 Load the Resources rules

Paste Prompt 2 below.

❏ PROMPT 1 — ACTIVATE THE BOOST

First — install and activate the Antigravity Protocol skill.
Let me know when it is complete and how you are enhanced now.

❏ PROMPT 2 — TEACH CLAUDE THE RULES

Read the content in Resources Folder.
<paste full path to your Resources folder>
Learn it. Tell me when you are done.

❏ TIP — Claude's response wording will vary — what matters is it confirms Antigravity is active and lists the 4 docs it learned.

How To Open Remotion

Pick a starter template, let Claude scaffold the project, then open the live preview in Chrome.

[REMOTION TEMPLATES](#)[OPEN LOCALHOST:3000](#)

01 Pick a template

For beginners, 'Hello World' is the safest base. For dimensional scenes, '3D'. Or let Claude pick: say 'choose what's best — be adaptive to my requirements & script'.

02 Tell Claude to install Remotion

Paste the prompt below.

03 Open it in Chrome

Say 'Open Remotion with Chrome open.' If a tab doesn't open automatically, visit <http://localhost:3000> manually.

✂ COPY THIS PROMPT

Next – install the Remotion skill.

```
npx create-video@latest
```

Let me know when you are done.

Use the <Hello World | 3D | adaptive> template.

Generate Motion Graphics

Drop a script into your project folder, point Claude at it, then unleash creative direction lock for each batch of scenes.

01 Drop your script .docx (or .txt) into the project folder

Put it right next to your Resources and Skills folders.

02 Have Claude read it and draft scenes

Paste Prompt 1 below.

03 Build the first 5 scenes with a creative direction

Paste Prompt 2. Claude will lock a creative direction and generate the visuals.

04 Switch the direction every 5 scenes

Paste Prompt 3 between batches. This is how you keep visual variety across one video.

❏ PROMPT 1 — READ SCRIPT + DRAFT SCENES

I added a script to the folder:

<paste folder path>

It's called: <your script title>.

Read it – then draft out scenes for the script.

❏ PROMPT 2 — FIRST CREATIVE-LOCKED BATCH

Build the first 5 scenes – use your creative unlock.

State your creative direction as such:

"Creative direction locked: <your choice>.

Think <2-3 sentence visual description>."

❏ **PROMPT 3 — ROTATE DIRECTION EVERY 5 SCENES**

For the next 5 scenes, change your creative direction lock.

Use something new. That you haven't.

Showcase your choice again, then generate the next 5 scenes.

❏ **TIP — Don't refine yet. Push through all 30 scenes first to see the full range. Revisions come in Part 9.**

Render The Scenes

One prompt. Claude bundles the project once, renders every composition, and drops MP4s into an 'out' folder.

01 Ask for the out folder

Paste the prompt below. Swap 1080p for 4K if you want.

02 Wait

Renders take a few seconds each at 1080p, longer at 4K. You'll see them appear as they finish.

03 Open the out folder

Inside your project, a folder named 'out' now holds every scene MP4 — Scene01-Name.mp4 through Scene30-Name.mp4.

✕ COPY THIS PROMPT

Create the out folder with all the scenes. Make them 1080p.

(or)

Create the out folder with all the scenes. Make them 4K.

Add Scenes To Your Video

Editor-agnostic — DaVinci Resolve shown, same flow in Premiere/Final Cut. Mark the script timeline, drag scenes in, add push transitions + whooshes.

01 Open your edit timeline

Have your face-cam / voiceover already cut. Captions help you see where each scene anchors.

02 Mark each scene point on the timeline

Scrub to where the scene's keyword is spoken → press M twice → name it Scene 1, Scene 2, etc. Repeat for all 30.

03 Drag scenes onto the playhead

Move the playhead to each marker, drag the matching scene clip on top.

04 Add a Push transition + whoosh SFX

Effects → Video Transitions → Push, drag to both ends of each scene. Shorten for snap. Add whoosh SFX on both ends.

05 Drop background music + flatten

Chill beat under everything. Convert to a compound clip if you want to speed it up or sync test.

🔗 TIP — A full motion-graphics pass that used to take days drops to under an hour with this flow.

Revise Scene Layouts

Need a scene to fit on only one side of the screen (next to your face cam)? Use the Layout Revision prompt — Claude reorients the scene to fit cleanly.

01 Open the Revision Prompts doc

It's in your Resources folder.

02 Use the layout-revision prompt

Paste below. Replace the scene number and the target zone (e.g. 'left 35% of screen' or 'top 50%' for vertical).

03 Drop the new version over the original in your edit

The versioning rule (set in Part 3) keeps the original scene intact. The new file appears as Scene X V2 — drag it on top of the previous one.

04 Crop in your editor if needed

In DaVinci, pull the crop to the split line so only the motion-graphics side shows. Your face cam fills the rest.

✂ COPY THIS PROMPT

For Scene <N>, redesign the motion graphics to sit on the <left 35% | right 35% | top 50% | bottom 50%> of the screen only, with a sharp split at the center. Leave the opposite side completely empty for webcam placement. Do not just scale the scene down — recompose and restructure it so it still looks clean, balanced, and intentional within that side.

Remove The Background

Turn any scene into a green-screen-ready clip. The prompt also tells Claude to use solid, high-contrast foreground colors so the keyer pulls cleanly.

01 Use the chroma-key prompt

From the Revision Prompts doc. Replace the scene number.

02 Bring the new version into your edit

Drop it on top of the existing scene clip.

03 Apply the 3D Keyer

Effects ▣ Resolve FX ▣ 3D Keyer ▣ drag onto the clip. Set the Open FX overlay, draw a short line over the green area. Done.

04 Tune Despill, Flat, or Tight

In the Inspector, nudge Despill up. Try Flat vs. Tight and pick the cleanest edge.

▣ COPY THIS PROMPT

For Scene <N>, use a solid pure chroma green background: #00FF00. No gradients, no shadows, no texture, no fog, no glow, no vignette, no lighting variation. Keep the background perfectly flat, clean, and fully consistent so it can be cleanly removed with the DaVinci Resolve 3D Keyer. Do not use any green anywhere inside the motion graphics, UI, text, icons, or design elements.

Make all UI elements, panels, cards, graphics, and overlays fully solid and opaque. Can still have gradient or glassy look – just not transparent or semi-transparent – so they do not create edge issues, blending issues, or keying problems against the green background. The foreground elements should feel visually separate from the background with strong contrast, clean edges, and enough boldness to clearly pop off the screen for easy background removal.

Add Images Into Remotion

Claude + Remotion alone don't generate images. Bring your own — thumbnails, screenshots, product shots — and Claude wires them into your scenes.

01 Generate or gather your images

Example: 10 vertical MrBeast-style thumbnails from ChatGPT or Midjourney.

02 Create a 'pngs' folder in your project

Drop the images in.

03 Ask Claude to slot them into the scene

Paste the prompt below. Be specific about WHICH visual element the images should replace (phone screen, card, thumbnail block, etc.).

04 Re-key the final version in DaVinci if it's chroma-ready

Same flow as Part 10 — 3D Keyer, despill, done.

✂ COPY THIS PROMPT

Now remove the text on the <phone | card | etc> and select one image to be on the <element> for each slide.

Images are in this folder:
<paste pngs folder path>

Final Workflow Recap

You just retired the slowest part of your editing process. Here's the one-page mental model — print it, pin it, ship videos.

[📺 WATCH THE MASTERCLASS](#)[📺 4 CLAUDE USE CASES](#)

01 Setup once

Claude Desktop · Git Bash · Node.js · Chrome Extension (Part 1).

02 Per project

Project folder 📁 Resources + Skills 📁 drop in the 4 rule docs + fonts + Antigravity skill (Part 3).

03 Per session

Activate Antigravity + load Resources 📁 install Remotion 📁 open Studio (Parts 4–5).

04 Per video

Drop script 📄 30 scenes drafted 📄 batch-build with rotating creative directions 📄 render the 'out' folder (Parts 6–7).

05 Polish

Mark, drag, push-transition, whoosh, music (Part 8). Revise layouts (Part 9). Chroma-key for face-cam overlays (Part 10). Drop in custom images where needed (Part 11).

06 Ship

One session. One video. Days of work 📁 under an hour. Now go ship.

📌 TIP — If this guide saved you a single weekend of editing, that's the whole point. Please share it with one creator who's still doing motion graphics by hand.
