

The Morning *Gap* Worksheet

Track the 20-minute window between waking and real work — the one variable that predicted 90% of your good days.

NAME

DATE

AVG LATENCY (MIN)

1 Track Your Gap

- Log 7 mornings: **wake time**, **first touch** (phone / journal / body movement), **minutes to first focused task**.
- Rate each day **1–10** for productive, before bed, no overthinking.
- Circle mornings under **20 min** latency — how many scored high?
- Circle phone-first mornings — what's their *average* rating?

DAILY LOG

2 Find Your Doom-Scroll Morning

- Name one morning you did everything **"right"** — gym, coffee, desk on time — and the day still failed. What did you look at first?
- What feed pulled your attention before you'd chosen your own *first thought*?
- How many minutes did that input eat before you stood up?
- Swap that input for silence — what task would you have started instead?

THE FAILED DAY

3 Audit Sleep Debt vs. Wake Time

- Write 2 mornings: one **forced early** on poor sleep, one **natural** after paying off debt.
- Compare latency and output — which variable actually explains the gap?
- Bedtime both nights — be *exact*.
- Are you chasing an hour on the clock, or the hours behind it?

DEBT VS. CLOCK

4 Design Your No-Phone-First-Hour Test

- Pick **tomorrow's first task** tonight — write it down now.
- Decide where the phone sleeps — *not* arm's reach — and commit to the spot.
- Predict tomorrow's rating if hour one hits **zero screen**.
- Log the actual rating after — compare it to your phone-first average.

TOMORROW'S TEST
