

The Job Posting *Decoder* Worksheet

Turn 30 days of scraped hiring data into a resume rewrite, a rebranding-spotter, and a Week 1 build plan you'll actually ship.

NAME

DATE

ROLES APPLIED

1 Rank Your Skills Against the Real Numbers

- List your **top 8 skills**. Next to each, write its match rate: ML **73%**, Python **62%**, LLM **31%**, GenAI **28%**, NLP **20%**, Deep Learning **15%**, PyTorch **12%**, RAG **10%**, MLOps **10%**, SQL **9%**, AWS **7%**.
- Circle any skill you claim but *can't back with a project* — that's your gap, not a hype-chase target.

YOUR SKILL GAPS

2 Rewrite One Bullet the 'Say the Skill By Name' Way

- Write your current top bullet — probably a list: Python, SQL, Tableau skills.
- Rewrite it: name the **artifact** you built, put a **number** on the outcome.
- Example: *"built pipeline, cut manual QA from 6 hours to 45 minutes weekly."*
- No real number yet? That's the **project to do next** — not the bullet to fake.

BEFORE → AFTER

3 Spot the Rebranding in a Job Posting You've Seen

- Pull up **one posting** you've applied to or bookmarked.
- Find every LLM, GenAI, or AI Engineer mention.
- Ask: is this *deep learning fundamentals* under a new label?
- Write one sentence translating the trendy term into the real skill being tested.

TREND TERM → REAL SKILL

4 Audit Your Own Data Like the Methodology Did

- Pick one number you've quoted about your search — e.g. *"I've applied to 50 roles."*
- Apply one flaw: **title-only classification**, **no dedup**, **no weighting**, **broken keyword match**, or **double-counted entries**.

```
if "ai" in title.lower(): classify_as_ds_role(job)
# false positives AND false negatives
```

FLAW APPLIED → VERDICT

5 Run Week 1 of the Four-Week Rebuild

- Block **Days 1–3** this week: build one trivial LLM tool — Slack bot or CLI Q&A — using chat completions, streaming, `function/tool calling` on the OpenAI or Anthropic API. Skip theory videos.
- Write the **exact tool** you'll build:
- Write the **ship date**:

TOOL + SHIP DATE
